FOMO Store: Project Pack

Tagline: Your Town. Everything You Need. **Last updated:** 24 October 2026

FOMO Store is a physical supermarket opening in Rajauli, Nawada, Bihar, India, plus a delivery app under the same brand. The shop and the app share one catalog, one set of prices and one inventory.

Files in this pack

File	What it covers
01-business-overview.md	What the business is, who it serves, principles, roadmap, open decisions
02-product-spec.md	The apps, user roles, screens, order flow and business rules
03-tech-and-design.md	Tech stack, database, security, brand and design system
04-launch-plan.md	Launch workstreams, legal registrations, build plan, costs, status
FOMO-STORE-COMPLETE.md	All of the above in one file, for pasting into an AI chat

If you are an AI assistant reading this

- Treat these files as the source of truth about the project.
- Do not invent details (prices, addresses, budgets, dates, statistics). Anything marked **[OPEN]** or in square brackets is undecided or unknown. Ask the founder instead of guessing.
- The founder, Ankit Yadav, has no coding background. Explain things in plain language and give step-by-step instructions.
- Legal and tax details are a snapshot and may change. Remind the founder to confirm with a local CA or the relevant office.

If you are a person reading this

Start with 01-business-overview.md, then read whichever file matches how you can help (product, tech, or launch).

---

01. Business Overview

What FOMO Store is

A neighbourhood supermarket in **Rajauli, Nawada, Bihar**, with a delivery and pickup app under the same brand. Customers can walk into the shop or order through the app. Both use the same catalog, prices and stock.

Tagline: Your Town. Everything You Need.

Who it serves

Families and households in Rajauli and nearby areas who need groceries and daily essentials.

What it sells

- Grocery staples
- Dairy
- Fruits and vegetables
- Snacks and beverages
- Personal care
- Household items
- Stationery
- More categories can be added by the owner at any time

Principles

1. **One price everywhere.** Same price in the shop and in the app.

2. **Cash on delivery from day one.** Online payment comes later.
3. **Local and trusted.** A real shop people can visit and talk to.
4. **Simple to use.** The app should be easy even for people new to smartphone shopping.
5. **Owner in control.** Delivery fee, minimum order, free-delivery threshold, delivery radius and opening hours are settings the owner can change, never hard-coded.

Revenue

Retail sales through the shop and the app. The delivery fee and free-delivery threshold are owner-configurable.

People

- **Founder and operator:** Ankit Yadav, a BBA student with no coding background. He is handling all non-app work himself (legal, money, location, suppliers, billing, staff, marketing) and is building the app with AI coding tools.
- **Planned roles to hire or arrange:** cashier, stockers, delivery riders. **[OPEN]**

Roadmap

Version 1 (launch): customer app, owner dashboard, simple rider screens, cash on delivery, marketing website. **Later:**

- Partner merchants selling through the app (a local marketplace). This changes legal, tax and food-licence requirements, so it waits until the own-stock store is running.
- Online payments (UPI and cards) through a payment gateway.
- Push and WhatsApp order updates.
- Hindi language support.

Open decisions [OPEN]

- Exact shop location and size
- Total budget and working capital
- Suppliers and wholesalers

- Opening date
- Delivery radius and delivery fee amounts
- Whether the store runs under the founder's existing sole proprietorship or a new entity
- Payment gateway and SMS OTP provider

---

02. Product Spec

The three pieces for launch

1. **Customer app**: the main product, a mobile-first installable web app (PWA).
2. **Owner dashboard**: a web panel for the shop owner, works on desktop and phone.
3. **Rider app**: a very simple mobile screen for delivery partners.

A **Merchant** role is planned for later. Version 1 does not build it, but the database is designed so it can be added.

All three live in one project with role-based login. Routes: `/` (customer), `/admin` (owner), `/rider` (rider). After login, users are sent to the right area for their role.

Customer app

Bottom navigation: Home, Categories, Cart, Orders, Account.

- **Home:** store name and tagline, delivery or pickup toggle, store open or closed banner, search bar, category chips, promo banner, Popular items, New arrivals.
- **Browse:** category grid, product lists (image, name, unit, price, MRP with discount, Add button that turns into a quantity stepper), product detail, live search.
- **Cart:** items, price breakdown (subtotal, delivery fee, discount, total), "Add Rs X more for free delivery" hint, minimum-order check.
- **Checkout:** login by phone OTP only at checkout, saved addresses (with landmark and pincode, delivery radius check), delivery or pickup, Cash on Delivery (UPI is a placeholder for later).
- **After ordering:** confirmation screen, My Orders list, live order tracking timeline with

rider name and call button, reorder button, cancel allowed only before packing starts.

- **Account:** profile, addresses, support (call or WhatsApp the store), logout.

Owner dashboard (/admin)

- **Live Orders:** new-order alert (sound and visual), move orders through statuses, assign a rider, cancel with a reason.
- **Catalog:** add, edit, deactivate products, upload images, edit price, MRP and unit.
- **Categories:** add, edit, reorder, deactivate.
- **Inventory:** edit stock, low-stock highlights, stock history.
- **Bulk tools:** CSV import and export for products and stock.
- **Overview and reports:** today's orders and revenue, 7 and 30 day charts, top sellers, sales by day, category and payment method.
- **Customers, Riders, Offers (promo codes), Settings.**
- **Settings include:** store open or closed, opening and closing hours, delivery fee, free-delivery threshold, minimum order, delivery radius, store address and phone, banner message.

Rider app (/rider)

Online or offline toggle, list of assigned orders, order detail (customer name, address and landmark, call button, open in Google Maps, items, amount to collect for cash on delivery), "Picked up" and "Delivered" buttons, and a history of completed deliveries.

Order flow

Customer places order, the owner sees it live and confirms it, staff pack it, the owner assigns a rider, the rider picks up and delivers, and the customer sees every step live.

Statuses: placed, confirmed, packing, ready, out_for_delivery, delivered, cancelled.

Business rules

- Stock reduces automatically when an order is placed and never goes below zero.

- If an item goes out of stock during checkout, the order is rejected with a clear message.
- A closed store blocks checkout with a friendly message.
- Product price and name are copied into each order so old orders never change.
- Out-of-stock products are shown but cannot be added.

---

03. Tech and Design

Tech stack

- **Frontend:** React, Vite, TypeScript, Tailwind CSS, React Router
- **Backend:** Supabase (authentication, Postgres database, row level security, file storage, realtime updates)
- **App type:** mobile-first Progressive Web App (installable on phones)
- **Hosting:** Vercel or Netlify
- **Login:** phone number with OTP for customers and riders, email for the owner

Database tables

categories, products, inventory, addresses, carts, cart_items, orders, order_items, order_status_history, store_settings, delivery_partners, profiles (linked to auth users with a role: customer, admin or rider). Promo codes and a waitlist table for the website are added later.

Security rules (row level security on every table)

- Customers can read the catalog and only their own cart, addresses and orders.
- Riders can only see orders assigned to them.
- Admins can do everything.
- Only the owner can change user roles. New signups default to customer.

Brand and design system

- **Colours:** navy `#0B1F4B` (primary), white (background), orange `#FF7A1A` (accent). Supporting tones: light grey-blue `#F4F6FB`, soft orange tint `#FFF1E4`, green for success, red for errors.
- **Contrast rule:** use navy text on orange buttons. Do not use white or orange text where contrast is weak.
- **Font:** Plus Jakarta Sans.
- **Style:** friendly, trustworthy, rounded cards, large tap targets (44px minimum), prices in INR (Rs).
- **Reusable components:** Button, Card, Input, Badge, BottomNav, Modal, Toast, EmptyState, Skeleton loaders.
- **Language:** English first, text structured so Hindi can be added.

Marketing website

A single-page site with: header, hero with tagline, product categories, "Order in three steps", "Why shop with FOMO", a launch waitlist (phone number saved to Supabase), a visit-us section (address, hours, phone), and a footer with the FSSAI licence number. Placeholders in square brackets (address, hours, phone, delivery radius, FSSAI number) must be filled with real details and never invented.

How it is being built

The founder uses AI tools: ready-made prompts for Antigravity (app build, 8 staged prompts), Lovable (brand, logo and interface design) and a website builder (marketing site). The recommended order is customer app, then owner dashboard, then rider screens, then polish and deployment. A freelance developer is planned to review security and bugs before launch.

---

04. Launch Plan

Status as of 24 October 2026: planning stage. The app is being built in stages with AI tools. Legal and registration research has started. Most other workstreams are not started.

Workstreams

1. **Legal and registrations** (started, see below)
2. **Money:** setup cost (deposit, racks, fridges, billing, interiors), first stock, monthly running costs, break-even sales per day. [OPEN]
3. **Location and setup:** shop selection in Rajauli, layout, shelving, cold storage, power backup, CCTV, signage. [OPEN]
4. **Suppliers:** wholesalers and FMCG distributors in Nawada, Gaya or Patna, pricing, margins, credit terms. [OPEN]
5. **Inventory and billing:** POS and barcode system with one catalog matching the app. Vyapar could handle billing at the start. [OPEN]
6. **People:** cashier, stockers, delivery riders, salaries and hours. [OPEN]
7. **Launch and marketing:** opening offer, WhatsApp and word of mouth, delivery radius and fees. [OPEN]
8. **App and website:** see 02 and 03.

Legal and registrations (snapshot, October 2026)

Rules, fees and thresholds change. Confirm each item with a local CA or the relevant office before paying anyone. This is not legal advice.

- **Udyam registration:** free and online. Useful for banks and loan schemes.
- **FSSAI (mandatory for food retail):** from 1 April 2026, basic registration covers turnover up to Rs 1.5 crore, and a State License covers Rs 1.5 crore to Rs 50 crore. Basic registration is about Rs 100 per year. Licences now have perpetual validity (no renewal). Turnover is not the only test, so check the exact business type on the FoSCoS portal.
- **GST:** registration is mandatory for goods once turnover crosses Rs 40 lakh in most states (Bihar is believed to be in this group). A supermarket will probably cross this within the first year. The composition scheme (lower flat tax) is available up to Rs 1.5 crore but gives up input tax credit, so compare both with a CA.
- **Shop and establishment registration:** unclear. Bihar repealed its Shops and Establishments Act from 1 June 2026 and now works under the OSH Code framework. A bill reported in July 2026 proposed mandatory registration only for establishments with 10 or more employees. Sources conflict, so ask the Labour Department or a CA.

- **Also check:** trade license from the local body, Legal Metrology verification for weighing scales, fire safety requirements, a current bank account.
- **Marketplace warning:** if partner merchants sell through the app, e-commerce rules apply. One source says an e-commerce platform needs a Central FSSAI licence regardless of turnover. This is why the merchant role waits until after launch.

Development cost (rough)

- Agency quotes for a similar grocery app with customer app, driver app and admin panel: about Rs 15 to 30 lakh.
- Estimated for this scope with a freelancer in India: roughly Rs 1.5 to 4 lakh. Small agency: roughly Rs 4 to 10 lakh. These are the author's estimates, not quotes.
- The founder's plan: build with AI tools, then pay a freelancer for a fixed-price security and bug review.
- Ongoing costs to remember: SMS OTP provider, payment gateway fees, domain and hosting, maintenance (agencies often quote 15 to 20 percent of build cost per year).

What a helper can do right now

- Fill in a workstream above that is marked [OPEN]
- Review the app build or the prompts
- Advise on the legal items with local knowledge
- Introduce suppliers, riders or staff in Rajauli and Nawada
